

UNIVERSITY OF SASKATCHEWAN
Department of Physics and Engineering Physics

Physics 111.6
MIDTERM TEST #2

November 17, 2005

Time: 90 minutes

NAME: _____
(Last) **Please Print** (Given)

STUDENT NO.: _____

LECTURE SECTION (please circle):

- 01 Dr. A. Robinson
- 02 B. Zulkoskey
- 03 Dr. K. McWilliams
- C15 F. Dean

INSTRUCTIONS:

1. You should have a test paper, a formula sheet, and an OMR sheet. The test paper consists of 9 pages. **It is the responsibility of the student to check that the test paper is complete.**
2. Enter your name and STUDENT NUMBER on the OMR sheet.
3. The test paper, the formula sheet and the OMR sheet must all be submitted.
4. The test paper will be returned. The formula sheet and the OMR sheet will NOT be returned.

PLEASE DO NOT WRITE ANYTHING ON THIS TABLE

| QUESTION NO. | MAXIMUM MARKS | MARKS OBTAINED |
|--------------|---------------|----------------|
| Part A | 10 | |
| Part B | 10 | |
| C1 | 5 | |
| C2 | 5 | |
| C3 | 5 | |
| TOTAL | 35 | |

continued on page 2...

- A7. Two particles with different masses are observed to have the same non-zero momentum. Which one of the following statements **must** be true?
- (A) The particles must have the same kinetic energy.
 - (B) The total momentum of the system of two particles must be zero.
 - (C) The particles must have the same speed.
 - (D) The particles must be at rest.
 - (E) The particles must be travelling in the same direction.
- A8. Four of the following statements apply to an object in equilibrium. Which statement is **not** a condition for equilibrium?
- (A) The sum of the externally applied torques is zero.
 - (B) The object has zero translational acceleration.
 - (C) The object has zero translational velocity.
 - (D) The sum of the externally applied forces is zero.
 - (E) The object has zero angular acceleration.
- A9. Which one of the following statements is **FALSE**?
- (A) The SI unit for moment of inertia is $\text{kg}\cdot\text{m}^2$.
 - (B) The moment of inertia of a body is equal to its mass.
 - (C) The moment of inertia of a body is dependent on the location of the rotation axis relative to the particles which make up the body.
 - (D) The moment of inertia is the ratio of the net torque acting on a rigid body to the angular acceleration (in rad/s^2) produced by the torque.
 - (E) The total moment of inertia of a rigid body can be obtained by summing the moments of inertia of the individual components of that body.
- A10. How should the mass of a rotating body be distributed so as to maximize its angular acceleration for a given applied torque?
- (A) The mass should be concentrated at the outer edge of the body.
 - (B) The mass should be evenly distributed throughout the body.
 - (C) The mass should be concentrated near the axis of rotation.
 - (D) The mass should be concentrated at a point midway between the axis of rotation and the outer edge of the body.
 - (E) Mass distribution has no impact on angular acceleration.

PART B

FOR EACH OF THE FOLLOWING PROBLEMS, WORK OUT THE SOLUTION IN THE SPACE PROVIDED AND ENTER YOUR ANSWERS ON PAGE 6.

ONLY THE ANSWERS WILL BE MARKED. THE SOLUTIONS WILL NOT BE MARKED.

B1. Calculate the time required to travel halfway around a circular track of radius 126 m at a constant speed of 62.1 m/s.

B2. A firework rocket of mass 0.125 kg is launched and rises to a maximum altitude of 84.5 m, where it has a speed of 0 m/s. The work done by non-conservative forces during the flight to this point is 82.9 J. Calculate the initial launch speed.

B3. A bat strikes a 0.145-kg ball so that the ball's velocity changes by 95.6 m/s in 0.00425 s. Calculate the magnitude of the average force with which the bat struck the ball.

B4. A ceiling fan undergoes an angular acceleration of -43.7 rad/s^2 as its angular velocity decreases from its initial value to a final value of $+66.9 \text{ rad/s}$ in a time of 2.61 s. Calculate the initial angular velocity of the fan.

B5. You open a door by exerting a force of 45.1 N at an angle of 20.7° to the surface normal and at a point 0.750 m from the door hinge. Calculate the torque applied to the door.

ANSWERS FOR PART B

ENTER THE ANSWERS FOR THE PART B PROBLEMS IN THE BOXES BELOW.

THE ANSWERS MUST CONTAIN THREE SIGNIFICANT FIGURES AND THE UNITS MUST BE GIVEN.

ONLY THE ANSWERS WILL BE MARKED. THE SOLUTIONS WILL NOT BE MARKED.

B1

B2

B3

B4

B5

PART C

IN EACH OF THE FOLLOWING QUESTIONS, GIVE THE COMPLETE SOLUTION AND ENTER THE FINAL ANSWER IN THE BOX PROVIDED.

THE ANSWERS MUST CONTAIN THREE SIGNIFICANT FIGURES AND THE UNITS MUST BE GIVEN.

NO CREDIT WILL BE GIVEN FOR ANSWERS ONLY. EQUATIONS NOT PROVIDED ON THE FORMULA SHEET MUST BE DERIVED.

- C1. A uniform solid disk of radius 0.343 m, starting from rest at a height 2.56 m above the ground, rolls without slipping down a ramp. Calculate the speed of the disk at the bottom of the ramp. You may assume that no non-conservative forces do work on the disk.

- C2. A curling rock of mass M is sliding along the ice in the $+x$ direction with speed v_0 when it mysteriously explodes into two pieces. The pieces remain in contact with the ice surface.
- After the explosion, one piece with mass $0.270 M$ moves at a speed of $v_{1f} = 7.35$ m/s at an angle of 10.5° counterclockwise from the positive y axis. The second piece, which has a mass of $0.730 M$, moves at a speed of $v_{2f} = 4.25$ m/s at an angle of 39.0° clockwise from the positive x axis.
- (a) On the given coordinate system, sketch the velocities of the curling rock and its pieces before and after the explosion.

- (b) Calculate the speed of the curling rock before the explosion. You may assume that the ice surface is horizontal and frictionless.

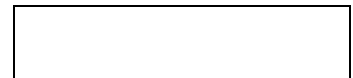

C3. A car is travelling around a flat, unbanked curve of radius r (friction is present). Let v_{\max} represent the maximum speed at which the car can negotiate the curve without sliding.

(a) Draw a well-labelled free body diagram of the forces acting on the car.

(b) Derive an expression for the coefficient of static friction, μ_s , between the tires and the road surface in terms of v_{\max} , r , and g .

(c) If the curve has a radius of 53.2 m and the car has a speed of $v_{\max} = 37.0$ km/h, calculate the coefficient of static friction.
